

ABSTRACT

The present invention includes: a box case having a size capable of containing an open type of cassette that can hold a plurality of first objects to be processed and capable of
5 containing a plurality of second objects to be processed, the second objects to be processed being larger than the first objects to be processed; a supporting part provided at an inside wall surface of the box case, the supporting part being capable
10 of supporting the second objects to be processed in a tier-like manner; an open-close lid provided at an opening part of the box case in a removable and attachable manner; and a positioning-engaging part provided at a bottom part of the box case in a removable and attachable manner. The open-close lid
15 is capable of sealing the box case. The positioning-engaging part is capable of engaging with a positioning part provided at a lower surface of a bottom part of the cassette to position the cassette.
